The Document Object Model (DOM) is a cross-platform and language-independent application programming interface that treats an HTML, XHTML, or XML document as a tree structure wherein each node is an object representing a part of the document. The DOM model represents a document with a logical tree. Each branch of the tree ends in a node, and each node contains objects.

No support for future content Support for future content is extremely valuable for single-page applications. Without it, you would have to invoke the initialization function every time you add content to the page. Basically, a developer wants to be able to drop <details> into the DOM and be done with it, and not have to fiddle with JavaScript to get it going.

Given the general support of .innerHTML these days, the only effective difference now is that .html() will execute code in any <script> tags if there are any in the html you give it..innerHTML, under HTML5, will not.. From the jQuery docs:. By design, any jQuery constructor or method that accepts an HTML string — jQuery(), .append(), .after(), etc. — can potentially execute code.
