1 Multivariate Logistic Regression As in univariate logistic regression, let  $P(x)$  represent the probability of an event that depends on  $p$  covariates or independent variables.

### **Multivariate Logistic Regression - McGill University**

With logistic regression we model the natural log odds as a linear function of the explanatory variable:  $\text{logit}(y) = \ln(\text{odds}) = \ln \frac{p}{1-p} = a + \beta x$  where  $p$  is the probability of interested outcome and  $x$  is the explanatory variable. The parameters of the logistic regression are  $\beta$  and  $a$ . This is the simple logistic model.

interval or ratio in scale). Multinomial logistic regression is a simple extension of binary logistic regression that allows for more than two categories of the dependent or outcome variable. Like binary logistic regression, multinomial logistic regression uses maximum likelihood estimation to evaluate the probability of categorical membership.

Logistic regression is used to obtain odds ratio in the presence of more than one explanatory variable. The procedure is quite similar to multiple linear regression, with the exception that the response variable is binomial. The result is the impact of each variable on the odds ratio of the observed ...
